the authors consider a schrödinger operator $h \Delta v x$ in dimension two with a quasi periodic potential $v x$ they prove that the absolutely continuous spectrum of h contains a semiaxis and there is a family of generalized eigenfunctions at every point of this semiaxis with the following properties first the eigenfunctions are close to plane waves $ei \square x$ in the high energy region second the isoenergetic curves in the space of momenta \square corresponding to these eigenfunctions have the form of slightly distorted circles with holes cantor type structure a new method of multiscale analysis in the momentum space is developed to prove these results the result is based on a previous paper on the quasiperiodic polyharmonic operator $\Delta |v x| 1$ here the authors address technical complications arising in the case $| 1$ however this text is self contained and can be read without familiarity with the previous paper

one appealing feature of string theory is that it provides a theory of quantum gravity gravity and strings is a self contained pedagogical exposition of this theory its foundations and its basic results in part i the foundations are traced back to the very early special relativistic field theories of gravity showing how such theories lead to general relativity gauge theories of gravity are then discussed and used to introduce supergravity theories in part ii some of the most interesting solutions of general relativity and its generalizations are studied the final part presents and studies string theory from the effective action point of view using the results found earlier in the book as background this 2004 book will be useful as a reference book for graduate students and researchers as well as a complementary textbook for courses on gravity supergravity and string theory

double sequence spaces and four dimensional matrices provides readers with a clear introduction to the spaces of double sequences and series as well as their properties the book then goes beyond this to investigate paranormed double sequence spaces and their algebraic and topological properties triangle matrices and their domains in certain spaces of double sequences dual spaces of double sequence spaces and matrix transformations between double sequence spaces and related topics each chapter contains a conclusion section highlighting the importance of results and pointing out possible new ideas that can be studied further features suitable for students at graduate or post graduate level and researchers investigates different types of summable spaces and computes their duals characterizes several four dimensional matrix classes transforming one summable space into other discusses several algebraic and topological properties of new sequence spaces generated by the domain of triangles

in the last few years there has been an explosion of activity in the field of the dynamics of fractal surfaces which through the convergence of important new results from computer simulations analytical theories and experiments has led to significant advances in our understanding of nonequilibrium surface growth phenomena this interest in surface growth phenomena has been motivated largely by the fact that a wide variety of natural and industrial processes lead to the formation of rough surfaces and interfaces this book presents these developments in a single volume by bringing together the works containing the most important results in the field the material is divided into chapters consisting of reprints related to a single major topic each chapter has a general introduction to a particular aspect of growing fractal surfaces these introductory parts are included in order to provide a scientific background to the papers reproduced in the main part of the chapters they are written in a pedagogical style and contain only the most essential information the contents of the reprints are made more accessible to the reader as they are preceded by a short description of what the editors find to be the most significant results in the paper
