does the field of evolution differ from other sciences the author a reviewer for a major medical journal scrutinized hundreds of scientific references in evolutionary literature adopting the same standards used for studies submitted for medical publication the data show that there are two types of evolution microevolution and macroevolution with a clear boundary between them based upon the presence and absence of empirical evidence respectively the surprising results show that there is a universal disconnect between the data and the conclusions that claim

to show the larger changes of macroevolution the author reveals patterns of deviations from standard scientific methods in these studies for the first time evolutionary data have been summarized to describe both what evolution can and cannot accomplish the author shows the reader how to recognize the different ways in which the evidence for microevolution within and between some species differs from the unsupported macroevolution of most species previous critiques of macroevolution have been debunked by advocates who have cited a multitude of scientific studies this book goes beyond previous critiques by directly addressing the data from these studies to see if they do in fact support macroevolution focused conclusions many expert counterarguments against this book's thesis are presented and examined in the context of scientific research to reassure the reader that the author has left no stone unturned in the macroevolution debate a theory is proposed as to why there may be no empirical evidence for macroevolution the book concludes with a section entitled what we see differently there the author shows the reader the differences in perspective between the evolutionist and macroevolution critic as they look at and interpret the very same set of data

the widespread use of mouse models in developmental behavioural and genetic studies has sparked wider interest in rodent biology as a whole this book brings together the latest research on rodents to better understand the evolution of both living and extinct members of this fascinating group topics analysed include the role of molecular techniques in the determination of robust phylogenetic frameworks how geometric morphometric methods help quantify and analyse variation in shape and the role of developmental biology in elucidating the origins of skeletal elements and the teeth the editors unite these disciplines to present the current state of knowledge in rodent biology whilst setting the landscape for future research this book highlights interdisciplinary links across palaeontology developmental biology functional morphology phylogenetics and biomechanics making it a valuable resource for evolutionary biologists in all fields

although charles darwin predicted that his theory would give zest to metaphysics even he would be astonished at the variety of paths his theory has in fact taken this holds with regard to both gene darwinism a purified darwinian approach biologizing the social sciences and process darwinism found in the disciplines of psychology philosophy of science and economics although darwinism is often linked to highly confirmed biological theories some of its interpretations seem to profit from tautological claims as well where scientific reputation cloaks ideological usage this book discusses central tenets of darwinism historically as well as systematically for example the history of different darwinian paradigms the units of selection debate and the philosophical problem of induction as basis of metaphysical darwinism crucially the book addresses the darwinian claim that evolution is governed by an immutable and unrelentingly cruel law of natural selection paradoxically darwin's theory is a static non evolutionary theory of evolution the current book sketches the historical background and provides suggestions that may help to replace this approach by the idea of an evolution of evolutionary mechanisms see escher's drawing hands on the cover this view even suggests a tendency to overcome the blindness of the knowledge acquisition of primordial darwinian processes and allows for some freedom from external environments this book first develops a radically darwinian approach then criticises this approach from within even darwinism has a tendency to transcend itself although the book addresses several empirical issues it does not challenge particular findings instead it builds on many insights of darwinism and provides a proposal for interpreting known empirical evidence in a different light it should

help pave the way for further developing an understanding of nature that transcends darwinian metaphysics publisher s description
